

in this one you can see the second red candle (on the crosshair) has been continuing the trend from the prior red bearish engulfing candle which formed after a green doji (two bars prior) that bounced off the green upper bband when the 1m yellow upper band was well beyond the longer green (5m) and blue (15m) timeframes upper bands. That same candle under the crosshair is also pausing at this point as it went below the lower yellow 1m band. the next bar bounces up to the yellow solid line (1m 20dma / bb centerline), off it as resistance and then continues back to pause at the dotted green line, the 5m 9dma, forming a gravestone doji that suggests the trend is likely still bearish

For this one you see the opening 5min candle 2 bars left of the one with the crosshair on it. This first candle even though red and bearish, it's wick was well beyond all 3 lower bband lines so we likely would have opened a bullish spread expecting at least a retest of that confluence of bands in the middle that marks the upper end of the red candle and the green bullish engulfing candle breaks through them all confirming likely continuation to the next upper bands - so we'd open another long call spread around that candle close (and/or the confluence of bands around there) but then the next candle's wick (red to the right of the crosshair) is not only above the upper bands of the green and blue 5 and 15 min bands, but the yellow upper is well beyond the longer timeframes once again suggesting a good place to open bearish spreads and likely cover the bull ones

Here on the next page we see a tombstone doji three bars left of the crosshair, again trading between that collection of bands. then the next candle (2 left of cursor) is a very large doji so that one 5 min candle (when monitoring it each min through the motion of the 5 min candle) may have triggered both a bear put spread when it was at the top of that 1min upper band (upper yellow dotted) and a bull call spread as it fell to the other side of the lower yellow band which also aligned to the lower green band providing good support. The next candle opens below that confluence of solid and dashed green and yellow lines (the 20dma and 9ema of the 1 and 5 timeframes) and it's also breaking below the longer 15 min solid line which is it's 20dma that was acting as support, so once it broke, early in the candle, it suggested continuation down. That one found support at the lower bband (lower blue dotted) we could have covered at that point but it's in an ongoing 4 or 5 bar downtrend at this point so we may be hesitant to cover just yet since even though we're below the yellow, the yellow is still within the blue channel, however the next candle is another red one that extends well beyond all lower timeframe bands AND at this point the yellow lower band is also well beyond all the others so we'd be looking to optimistically open a call spread and look for the candles to again retrace and retest the lines above. Since the next candle to the right of the cursor is green, broke the prior red candles high and is testing the collection of averages again, we're beginning to confirm our bullish position and closes around these levels or the next candles that close above them suggest continued bullish moves up to the upper bands. You can also see this trend continue candle after candle so this would suggest opening another call spread on these 15m closes. You can also see in this case where the 1m 9EMA (yellow dashed uptrending line) is acting as support for each green candle confirming the uptrend

BB 29,642.16/29,576.22/29,510.28 9EMA 29,547.45

Doji at the top of this trend where yellow is extended above the green dotted upper band line marks a likely top

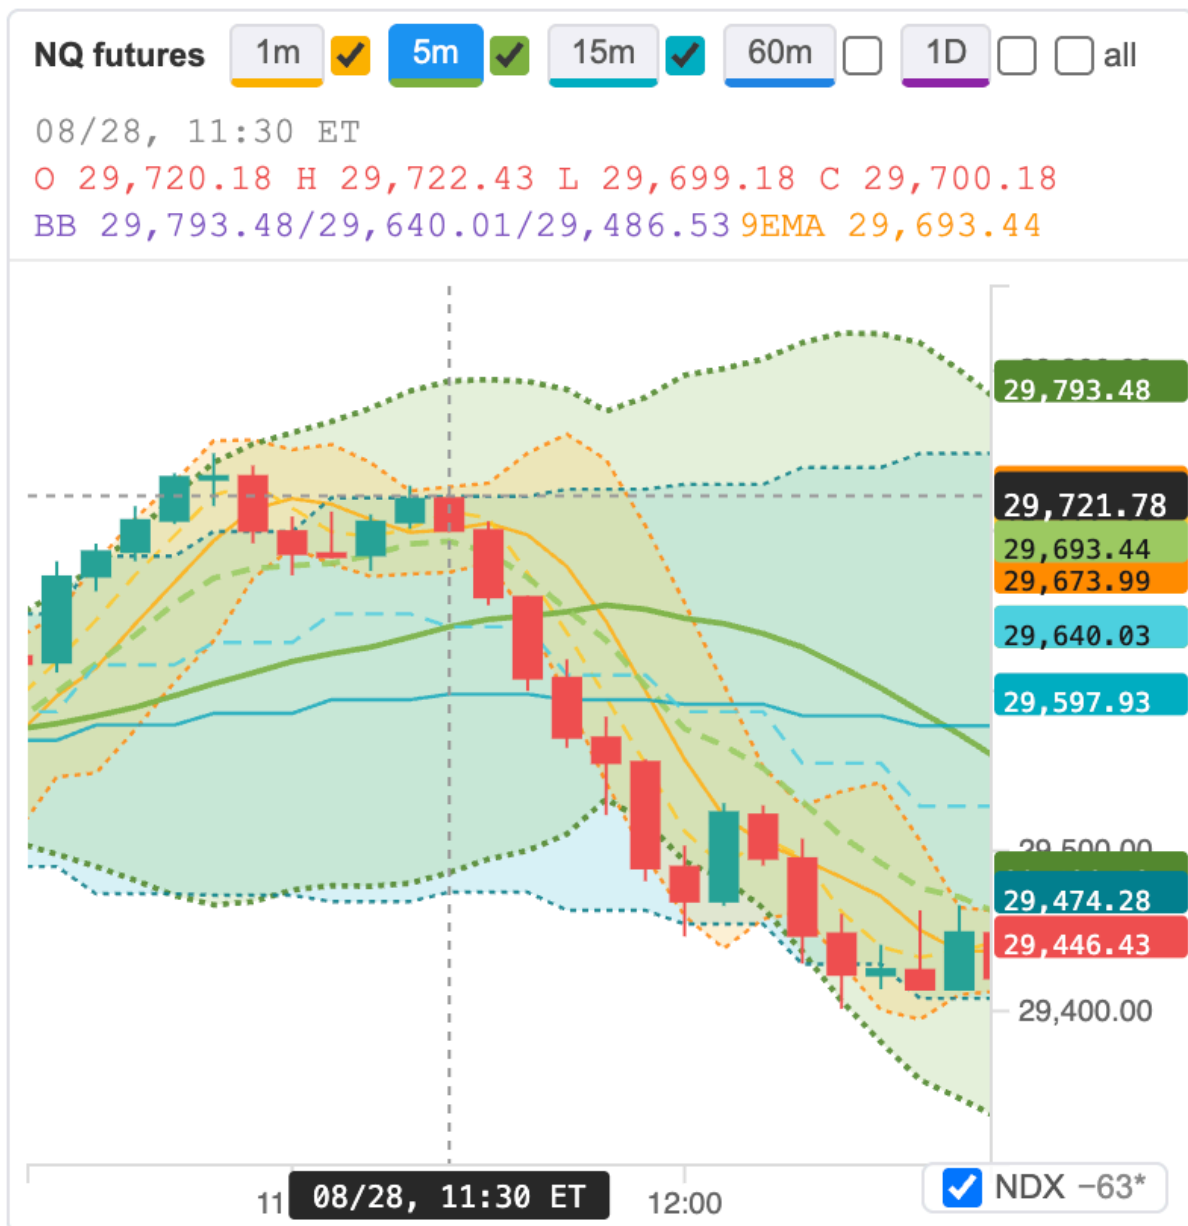

the potential gravestone doji 5 candles prior is a false alarm for a reversal since the yellow is still well within the green and it's just pausing at resistance of the confluence of the green, and blue dotted upper bands. If this were followed by another red candle we'd likely reverse and cover, however the yellow 1m 9EMA continued to hold support and resulted in another bullish green continuation leading to many more

Next two images go together with this description:

the doji we just referred to was the turning point (local top) as confirmed by the bearish engulfing but we may be cautious here because it's already getting close to the lower yellow band, but when the candles find support at the lower yellow band, but then strong resistance at the upper yellow and blue which are now at the same level, then once again break the solid yellow downward, that confirms the start of the bearish trend.

Again this trend is marked with the 1m 9ema and 20sma/bband center in a downtrend, with the 9ema acting as resistance for each candle which further supports and adds confidence to the downtrend, so we'd likely continue to add bearish positions with each 15 (and maybe even on the 5 min candle closes when the close between bands and therefore will likely continue further at least to the next line).

Looking at the candle marked by the crosshair: only when the yellow bands again extend beyond the lowest blue band, do we optimistically cover some of the prior bear spreads or possibly pick up a bull call spread but in this case - but we're still cautious as the solid 1m 20sma (solid yellow line) looks to act as resistance and the red candle after the green one starts to support that

now we're starting to see the the yellow stay within the green and blue lines and the candles stop breaking new lows. From here the candles more or less bounce from the lower yellow to the upper yellow bands as the 1m bands stop their downtrend and move sideways with support on the lower blue (15m) bands. In this stretch we could buy call spreads on the lower yellow lines and cover with put spreads on the upper lines

The next few images are all the same day in 15m candles so you can see the same yellow bands acting as support or resistance on the outer bounds of the 15 min candles in the same way - similar commentary applies as the bands dont change and the 15 min are just made up of the 5 min candles but this shows how the 5 min can give more ongoing confidence or slightly earlier indicators than waiting for a 15 min candle to close

Yellow acts as both support and resistance on both ends of the candle wick. Each of these next few candles could be opened on one extreme and covered locking in a nice profit or possible covering on the other edge making a very large tent with profit potential

Green candles to the right of the crosshair starts outside the lower band (good speculative place for a call spread or bullish trend to begin) and the subsequent candles break the confluence of moving average lines - solid and dashed in the middle of the shaded areas, then continues even further but the third green candle is finally extended well beyond the upper bands of all the timeframes so that close is a good indicator of a bearish reversal or at least a change to cover the prior bullish positions. This reversal is confirmed when the long red candle first breaks the green candle that couldn't break the red candle at the peak. We don't need that 15 min candle to even close because the break of the prior candle lows and the lower yellow band suggests the continuation back toward the blue center bands and when they break toward the lower bands following the
